

## 1. Theory of multipartite correlations – Outline

- framework for the classification of multipartite correlations
- measures for the quantification of multipartite correlations
- algorithm for multipartite correlation clustering

## 2. Setting the stage

- state vector:  $|\psi\rangle \in \mathcal{H}$  (normalized)
- pure state:  $\pi = |\psi\rangle\langle\psi| \in \mathcal{P}$
- mixed state (of an ensemble):  $\rho = \sum_j p_j \pi_j \in \mathcal{D} = \text{Conv } \mathcal{P}$
- mixedness: e.g. von Neumann entropy  $S(\rho) = -\text{tr } \rho \ln \rho$
- distinguishability: e.g. relative entropy  $D(\rho||\sigma) = \text{tr } \rho(\ln \rho - \ln \sigma)$

## 3. Structure of multiorbital correlations

[1, 2, 3, 4, 5]

### Level 0: subsystems

- system:  $L = [n] = \{1, 2, \dots, n\}$
- subsystem:  $X \in 2^L$ , then  $\mathcal{H}_X, \mathcal{P}_X, \mathcal{D}_X$
- Boolean lattice structure:  $P_0 = 2^L$

### Level I: partitions

- partitions of the system:  $\xi = \{X_1, X_2, \dots, X_{|\xi|}\} \equiv X_1|X_2|\dots|X_{|\xi|} \in \Pi(L)$
- refinement:  $v \preceq \xi$  def.:  $\forall Y \in v, \exists X \in \xi : Y \subseteq X$  lattice structure:  $P_I = \Pi(L)$
- $\xi$ -uncorrelated states:  $\rho = \otimes_{X \in \xi} \rho_X \in \mathcal{D}_{\xi-\text{uncorr}}$ , then  $v \preceq \xi \Leftrightarrow \mathcal{D}_{v-\text{uncorr}} \subseteq \mathcal{D}_{\xi-\text{uncorr}}$
- $\xi$ -correlation ( $\xi$ -mutual information):

$$C_\xi(\rho) = \min_{\sigma \in \mathcal{D}_{\xi-\text{uncorr}}} D(\rho||\sigma) = \sum_{X \in \xi} S(\rho_X) - S(\rho)$$

- multipartite monotonicity:  $v \preceq \xi \Leftrightarrow C_v \geq C_\xi$

### Level II: multiple partitions

- down-sets of partitions:  $\xi = \{\xi_1, \xi_2, \dots, \xi_{|\xi|}\} \subseteq P_I$  (closed downwards w.r.t.  $\preceq$ )
- partial order:  $v \preceq \xi$  def.:  $v \subseteq \xi$ , lattice structure,  $P_{II} = \mathcal{O}_\downarrow(P_I) \setminus \{\emptyset\}$
- $\xi$ -uncorrelated states:  $\mathcal{D}_{\xi-\text{uncorr}} = \cup_{\xi' \in \xi} \mathcal{D}_{\xi'-\text{uncorr}}$ , then  $v \preceq \xi \Leftrightarrow \mathcal{D}_{v-\text{uncorr}} \subseteq \mathcal{D}_{\xi-\text{uncorr}}$
- $\xi$ -correlation:

$$C_\xi(\rho) = \min_{\sigma \in \mathcal{D}_{\xi-\text{uncorr}}} D(\rho||\sigma) = \min_{\xi' \in \xi} C_{\xi'}(\rho)$$

- multipartite monotonicity:  $v \preceq \xi \Leftrightarrow C_v \geq C_\xi$

- spec.:  $k$ -partitionability and  $k'$ -poducibility (chains)

$$\mu_k = \{\mu \in P_I \mid |\mu| \geq k\}, \quad \nu_{k'} = \{\nu \in P_I \mid \forall N \in \nu : |N| \leq k'\}$$

$k$ -partitionability-correlation and  $k'$ -poducibility correlation:

$$C_{k-\text{part}}(\rho_L) = C_{\mu_k}(\rho_L) = \min_{|\mu| \geq k} C_\mu(\rho_L), \quad C_{k'-\text{prod}}(\rho_L) = C_{\nu_{k'}}(\rho_L) = \min_{\forall N \in \nu : |N| \leq k'} C_N(\rho_L)$$

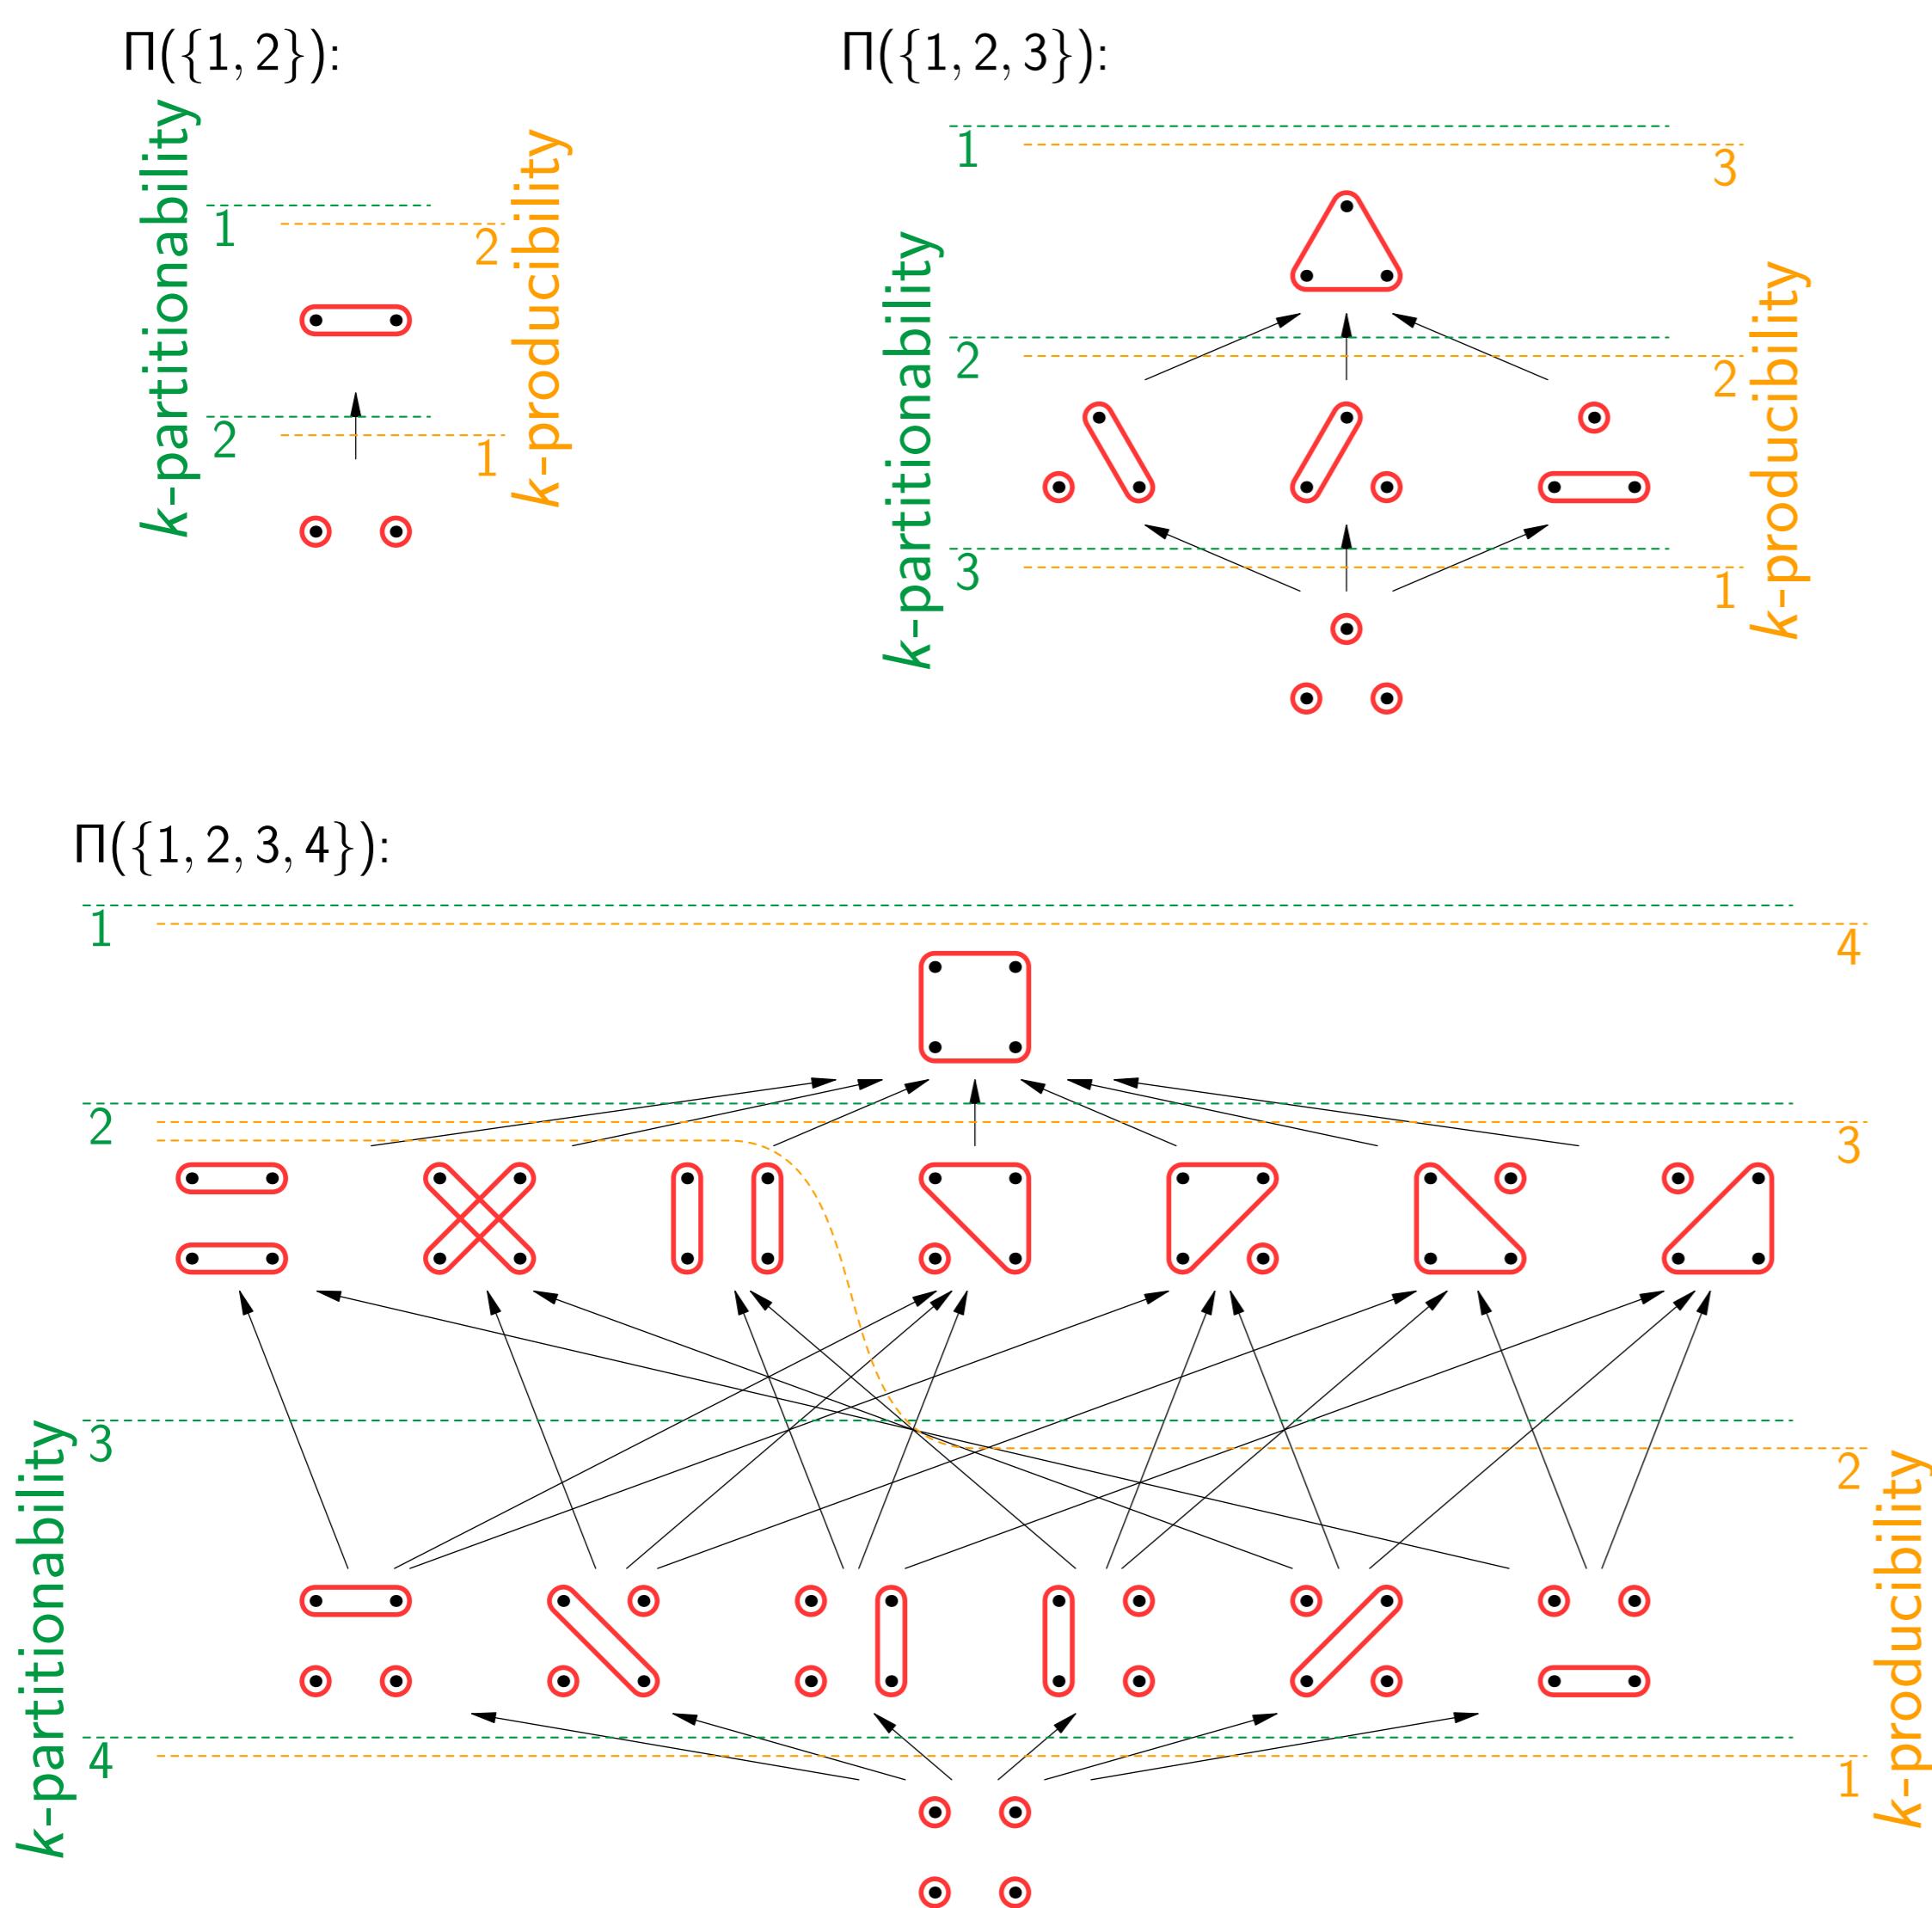

### Level III: classes, see [2]

- intersections of  $\mathcal{D}_{\xi-\text{sep}} = \text{Conv } \mathcal{D}_{\xi-\text{uncorr}}$

lattice structure:  $P_{III} = \mathcal{O}_\uparrow(P_{II}) \setminus \{\emptyset\}$

## 4. Illustrations

## 5. Multipartite correlation clustering

[1]

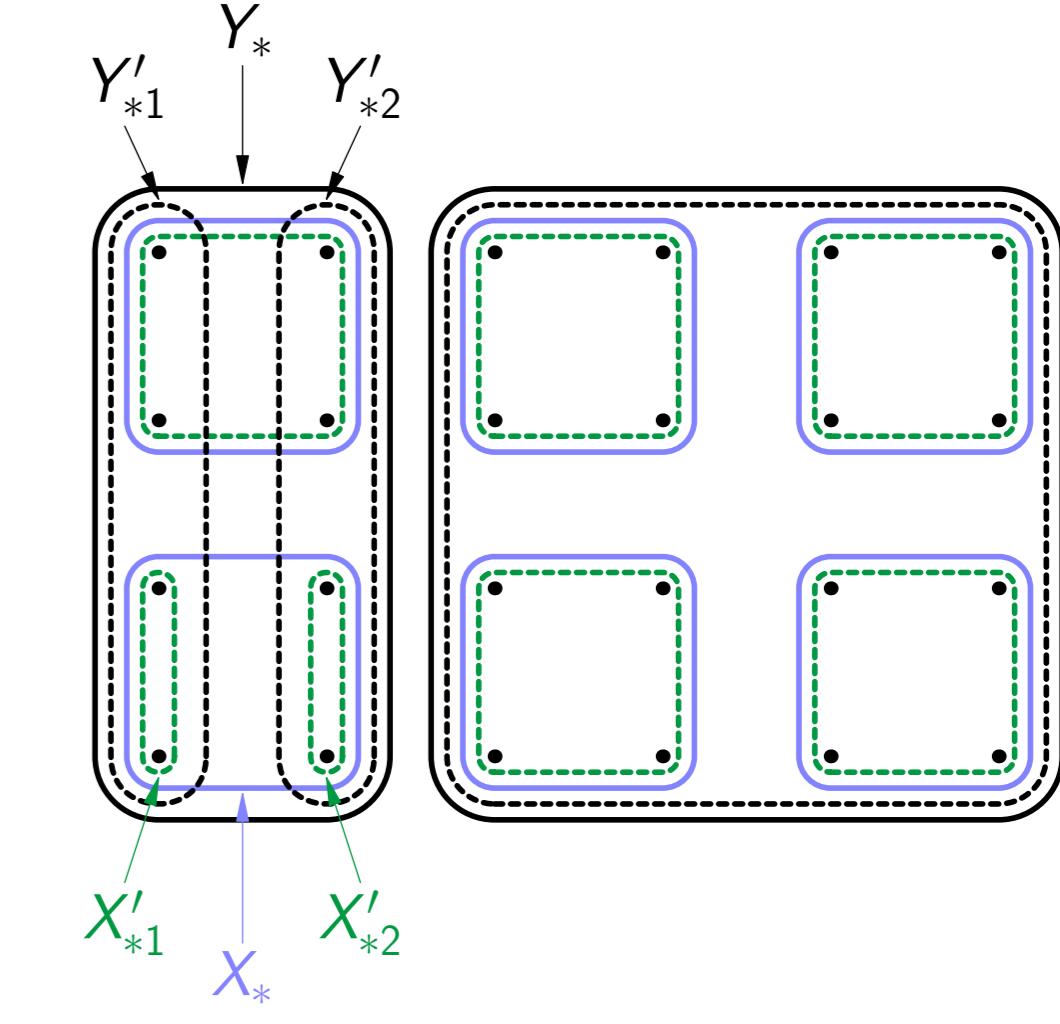

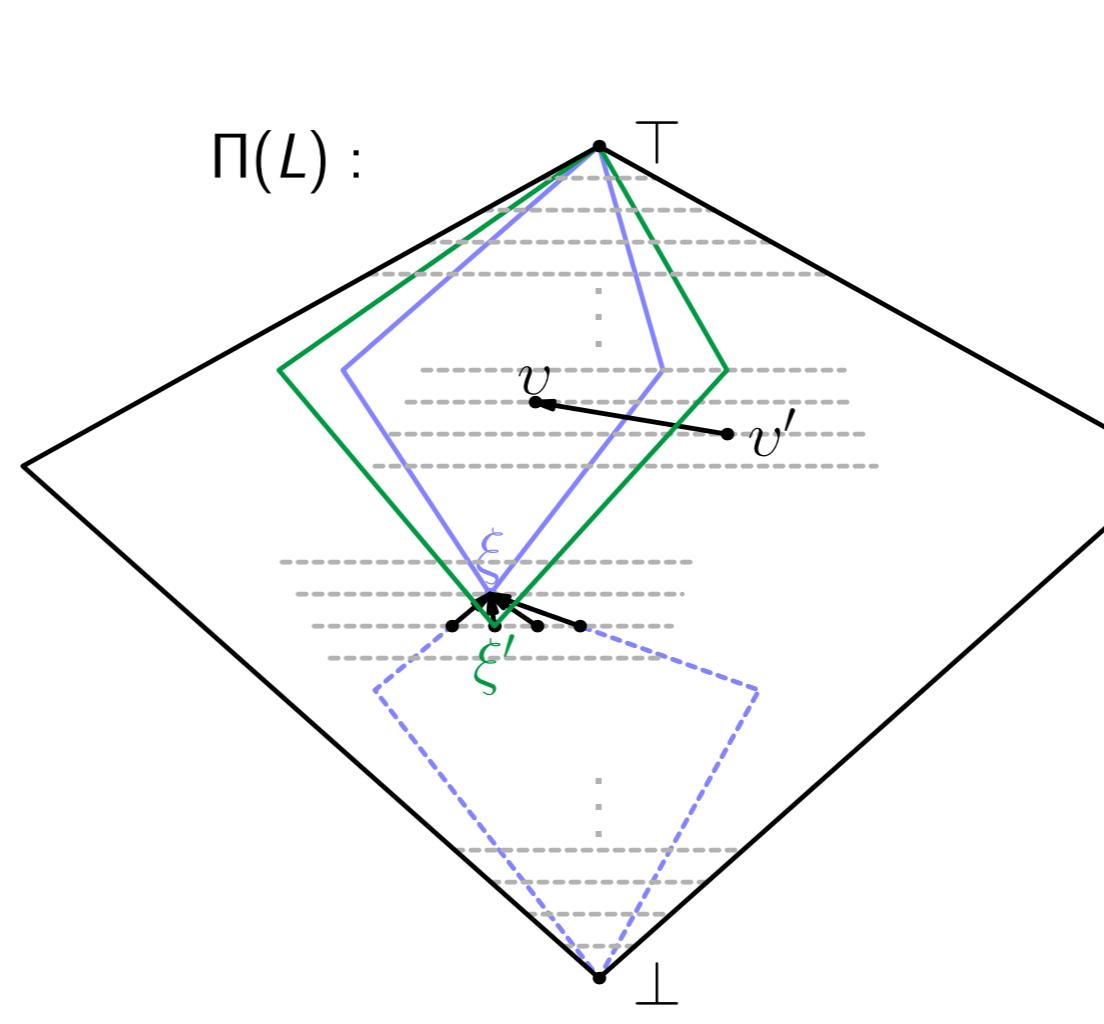

- bipartite correlation clustering:  $\gamma = G_1|G_2|\dots|G_{|\gamma|} \in \Pi(L)$  connectivity clustering of the graph of vertices  $L$  and edges  $C_{ij} \geq T_b > 0$
- multipartite correlation clustering:  $\beta = B_1|B_2|\dots|B_{|\beta|} \in \Pi(L)$ , for which
  - the subsystems described by the parts  $B \in \beta$  are weakly correlated with one another,
  - the elementary subsystems  $i \in B$  inside a part  $B \in \beta$  are strongly correlated with one another.
- covering (being neighbours):  $\xi' \prec \xi$  def.:  $\xi' \setminus \xi = \{X'_{*1}, X'_{*2}\} \in \Pi(X_*)$ ,  $\xi \setminus \xi' = \{X_*\} \in \Pi(X_*)$
- derivative:  $C_\xi(\rho_L) - C_\xi(\rho_L) = C_{\xi \setminus \xi}(\rho_{X_*})$
- reformulation:  $\exists T_m > 0$ , such that  $\forall \xi, \xi' \in \Pi(L)$  such that  $\xi' \prec \xi$ , and  $\beta \preceq \xi$ , then  $\beta \preceq \xi' \Leftrightarrow C_{\xi'}(\rho_L) - C_\xi(\rho_L) \leq T_m$

- there might not exist such clustering
- there may exist compatible clusterings, but there exist no contradictory ones:

- finding  $\beta$ : successive refinement from  $\top$  to  $\perp$  (taking the smallest step):  $\forall v, v' \in \Pi(L)$  such that  $v' \prec v$ , and  $\forall \xi \in \Pi(L)$  such that  $\xi \preceq v$  but  $\xi \not\preceq v'$ , then  $\min_{\xi' \prec \xi} C_{\xi'}(\rho_L) - C_\xi(\rho_L) \leq C_{v'}(\rho_L) - C_v(\rho_L)$

- hint:  $T_b \leq C_\xi(\rho_L) - C_\xi(\rho_L)$  for  $G \in \gamma$  (bipartite correlation clustering) if  $\xi$  does not dissect  $G$  while  $\xi'$  does, so don't dissect  $G$

- hidden correlation:  $\gamma \prec \beta$

## 6. Examples

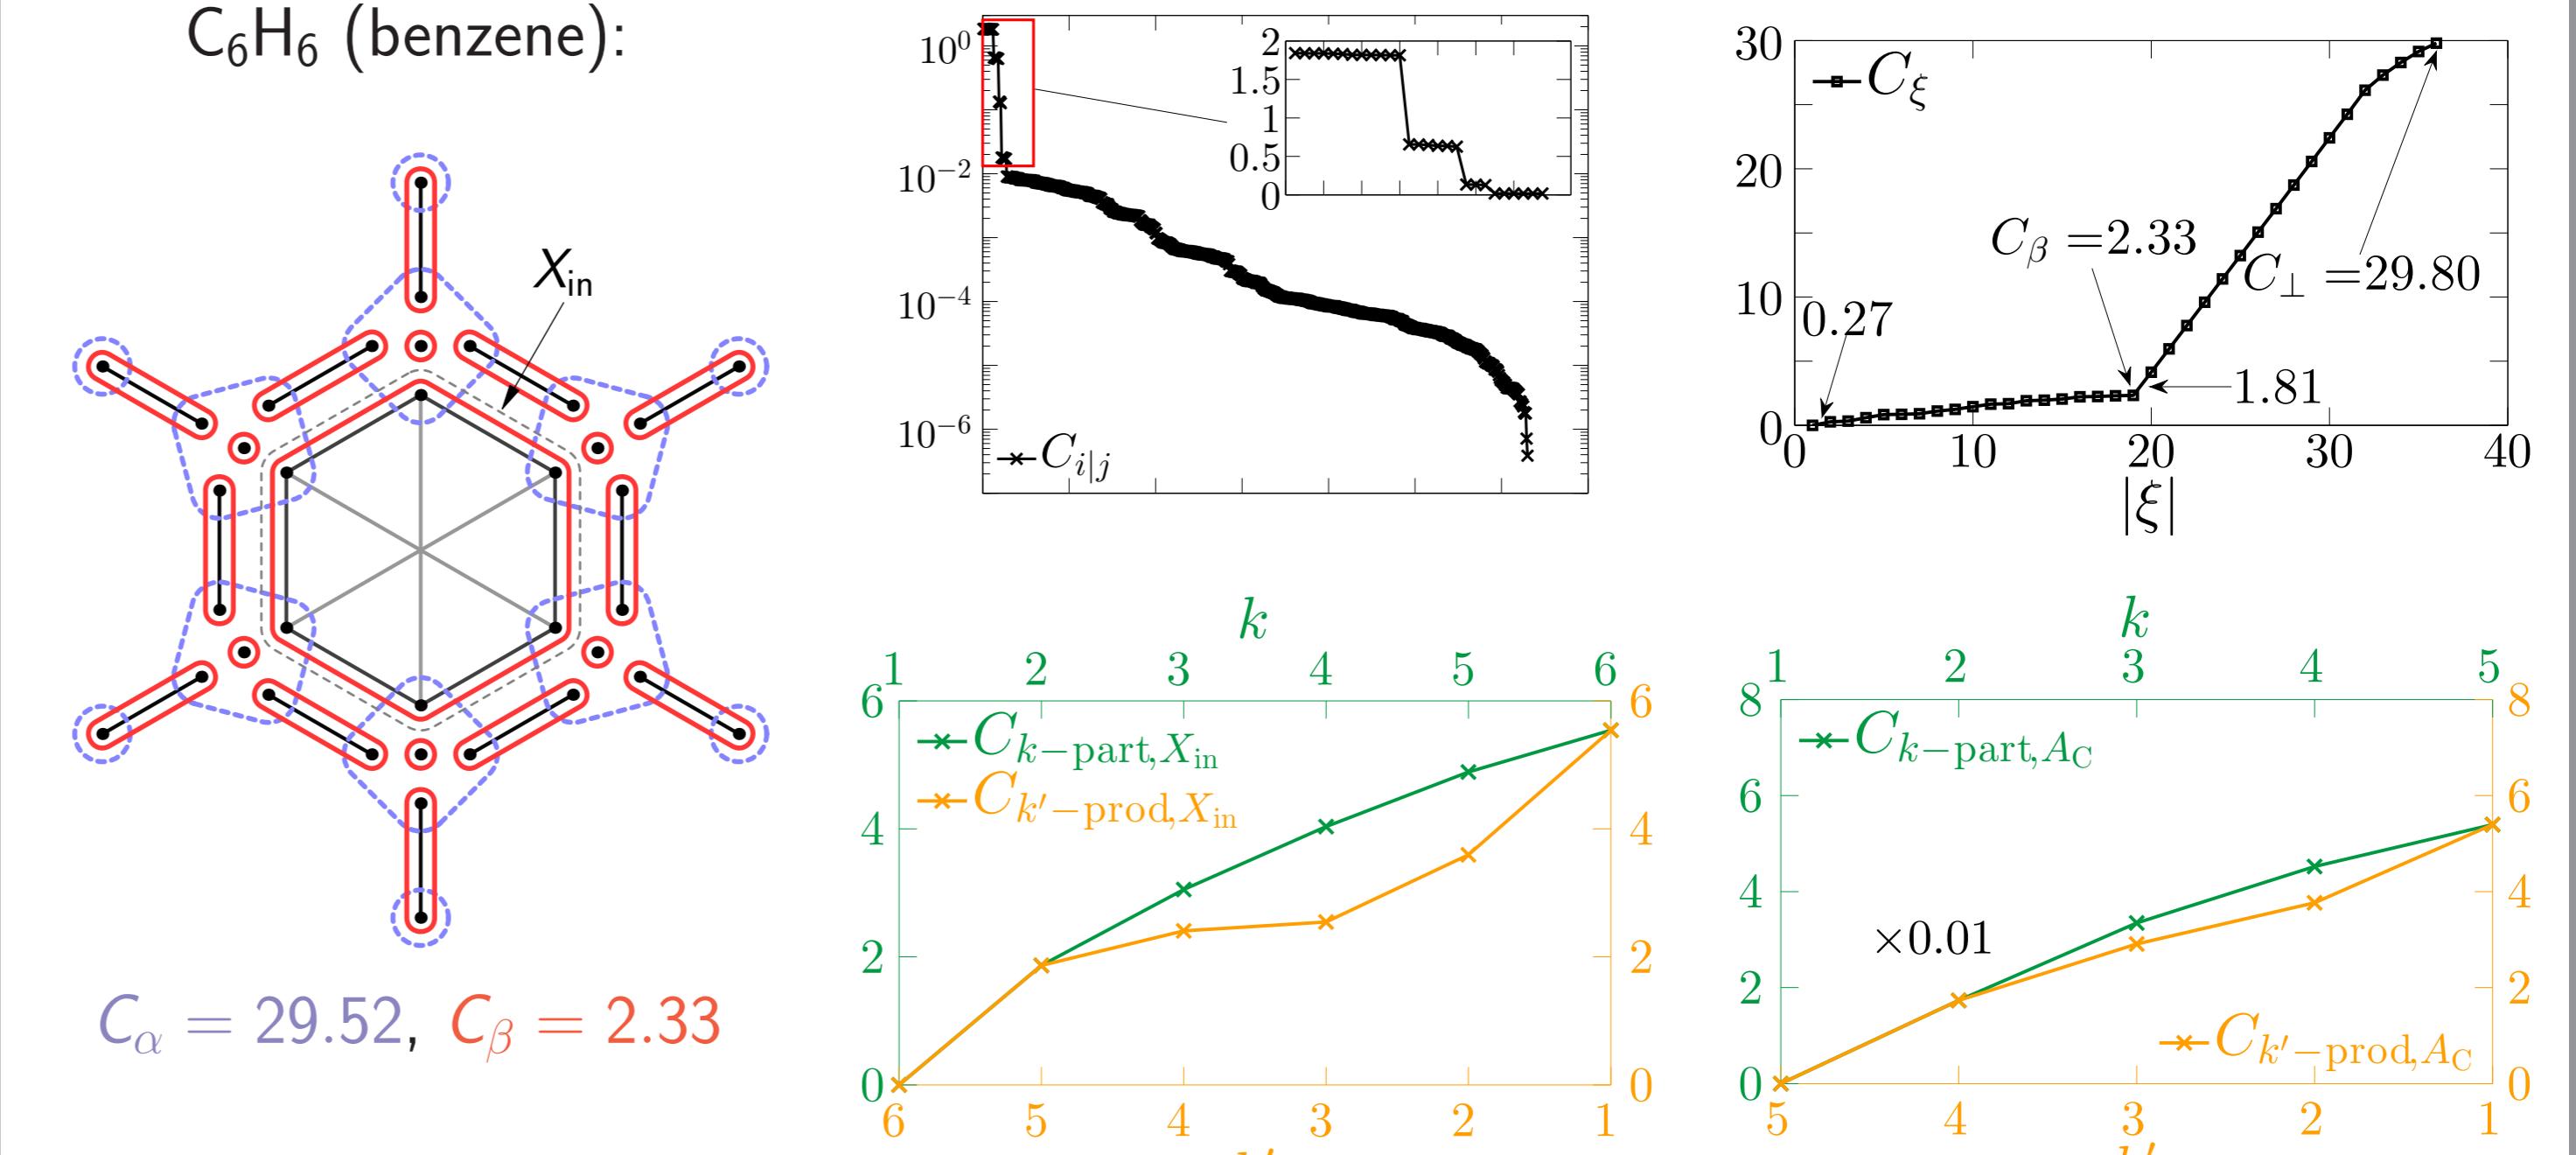

[1]

"atoms":  $\alpha = A_1|A_2|\dots|A_{|\alpha|}$ , "bonds":  $\beta = B_1|B_2|\dots|B_{|\beta|}$

$$\sum_{A \in \alpha} C_{\perp,A}(\rho_A) + C_\alpha(\rho_M) = \sum_{B \in \beta} C_{\perp,B}(\rho_B) + C_\beta(\rho_M) = C_\perp(\rho_M)$$

(values are in units  $\ln 4$ )

$C_6H_6$  (benzene):

$C_\alpha = 29.52, C_\beta = 2.33$

$C_\perp = 29.80$

$C_{\perp,b} = 0.27, C_{\perp,a} = 1.81$

$C_{\perp,c} = 2.33, C_{\perp,d} = 29.80$

$C_{\perp,e} = 0.27, C_{\perp,f} = 1.81$

$C_{\perp,g} = 2.33, C_{\perp,h} = 29.80$

$C_{\perp,i} = 0.27, C_{\perp,j} = 1.81$

$C_{\perp,k} = 2.33, C_{\perp,l} = 29.80$

$C_{\perp,m} = 0.27, C_{\perp,n} = 1.81$

$C_{\perp,o} = 2.33, C_{\perp,p} = 29.80$

$C_{\perp,q} = 0.27, C_{\perp,r} = 1.81$

$C_{\perp,s} = 2.33, C_{\perp,t} = 29.80$

$C_{\perp,u} = 0.27, C_{\perp,v} = 1.81$

$C_{\perp,w} = 2.33, C_{\perp,x} = 29.80$

$C_{\perp,y} = 0.27, C_{\perp,z} = 1.81$

$C_{\perp,a} = 2.33, C_{\perp,b} = 29.80$

$C_{\perp,c} = 0.27, C_{\perp,d} = 1.81$

$C_{\perp,e} = 2.33, C_{\perp,f} = 29.80$

$C_{\perp,g} = 0.27, C_{\perp,h} = 1.81$

$C_{\perp,i} = 2.33, C_{\perp,j} = 29.80$

$C_{\perp,k} = 0.27, C_{\perp,l} = 1.81$

$C_{\perp,m} = 2.33, C_{\perp,n} = 29.80$
